You can perform a variety of tasks using the Netsh command-line utility, including configuring the IP addresses of network adapters in Windows.

Here's how to configure a static IP address:

```
netsh interface ip set address "connection name" static 192.168.0.101 255.255.255.0 192.168.0.1
```

NOTE: The default connection names are Local Area Connection for wired adapters and Wireless Network Connection for Wi-Fi adapters. The IP address order: client IP, subnet mask, and gateway IP.

Here's how to configure the DNS addresses:

```
netsh interface ip add dns "connection name" 208.67.222.222
```
