Windows: Join a workgroup or domain from command line

[Add a Comment](#)[Author: [Michael Albert](#) Category: [Windows knowhow](#)]

Hi,

there are two ways to join or leave a domain. The netdom command or the Powershell Command lets add-computer and remove-computer.

The netdom way

Join a domain. If you are logged on at the machine you want to join

```
C:\> netdom join %computername% /domain:your.ADDomainToJoin.net /UserD:LoginWithJoinPermissions /F
```

Remove from Domain and join a workgroup. The /force option disjoins the computer from the domain even if you to not have the permission to remove the computer object from the domain. The domain computer object remains.

```
c:\> netdom remove %computername% /domain:your.OldADDomain.net /force
```

The Powershell way

[Join](#) a Domain

```
PS C:\> Add-computer -DomainName "your.ADDomainToJoin.net" -Credential LoginWithJoinPermissions
```

[Remove](#) from Domain and join a workgroup.

```
PS C:\> Remove-computer -WorkgroupName yourWorkgroup
```
